Although first reported in 1973, immune heparin-induced thrombocytopenia (HIT) remains one of the most frequent and devastating adverse drug reactions encountered by physicians. This thoroughly updated fifth edition from international experts Professors Warkentin and Greinacher is the gold standard for accurate diagnosis and management of this condition. Although transportation agencies in the U.S. have been developing Asset Management Systems (AMS) for specific types of infrastructure assets, there are several barriers to the implementation of AMS. This paper documents the development of a generic methodology for quantifying the benefits derived from implementation of AMS and justifying investment in AMS implementation. The generic methodology involves three analysis methods: descriptive analysis, regression analysis, and benefit-cost analysis. This paper demonstrates how the methodology can be applied to evaluate the implementation of a pavement management system in terms of efficacy, effectiveness, and efficiency (3Es). This book is the first title that focuses exclusively on kidney disease and its impact in the cardiac catheterization laboratory. The increasing prevalence of vascular risk factors such as diabetes, obesity and hypertension coupled with increased longevity has resulted in a worldwide epidemic of cardiovascular and chronic kidney disease (CKD). Never has the impact of one organ system on the other been so profound, as in the current context of cardio-renal interactions. The cross talk between the heart and kidneys is highly relevant in the field of interventional cardiology, given the increasing number of transcatheter procedures being performed in patients with underlying kidney disease. These procedures also have a significant impact on kidney function and require thoughtful interdisciplinary planning by a cardiorenal team, to achieve optimal outcomes. This book assembles the collective expertise of several international leaders in the field of interventional cardiology and nephrology to summarize this complex interface. The book is divided into seven sections to comprehensively cover the topic, including sections on best practices with reduction of contrast associated acute kidney injury, cutting edge techniques to minimize kidney risk with complex interventions, impact of transcatheter valvular procedures on kidney function and the utility of cardio-nephrology teams. Less recognized complications with high morbidity such as athero-embolic renal disease are featured prominently, to increase awareness in the interventional cardiology and nephrology communities. This book is a valuable resource for interventional and structural cardiologists, general cardiologists and nephrologists dealing with the significant overlap areas between these two specialties. It is also relevant to medical students, trainee physicians in nephrology and cardiology, advanced care practitioners and nursing personnel in both specialties. Given the major impact of kidney function on outcomes in patients undergoing cardiac procedures, this textbook serves as a focal point to integrate relevant clinical data from both specialties and help interventional cardiologists achieve

optimal outcomes, especially in patients with (or at risk for) kidney disease. . This book presents the papers from the Innovations in Fuel Economy and Sustainable Road Transport conference, held in Pune, India, 8-9 November, 2011. Papers examine advances in powertrain, alternative fuels, lightweight vehicles, electric vehicles and hybrid vehicles. An international assembly of senior industry representatives provide insight into research and technological advances in low carbon technology sustainability for road transport, helping towards achieving stringent emissions standards and continual improvements in fuel economy efficiency, all in an expanding Indian market. These technical papers from industry and academia discuss the developments and research of leading organisations. Discusses maximising powertrain performance for a low carbon agenda Provides readers with an understanding of the latest developments in alternative fuels Examines the future landscape for the implementation and development of electric vehicles The journal of Medical Association of Thailand publishes original and review articles including case report that relate to the study or research on diseases, epidemiology, drug or vaccine that have the influence on clinical course, treatment and prevention of human illness An increasing number of agencies, academic institutes, and governmental and industrial bodies are embracing the principles of sustainability in managing their activities. Life Cycle Assessment (LCA) is an approach developed to provide decision support regarding the environmental impact of industrial processes and products. LCA is a field with ongoing research, development and improvement and is being implemented world-wide, particularly in the areas of pavement, roadways and bridges. Pavement, Roadway, and Bridge Life Cycle Assessment 2020 contains the contributions to the International Symposium on Pavement, Roadway, and Bridge Life Cycle Assessment 2020 (Davis, CA, USA, June 3-6, 2020) covering research and practical issues related to pavement, roadway and bridge LCA, including data and tools, asset management, environmental product declarations, procurement, planning, vehicle interaction, and impact of materials, structure, and construction. Pavement, Roadway, and Bridge Life Cycle Assessment 2020 will be of interest to researchers, professionals, and policymakers in academia, industry, and government who are interested in the sustainability of pavements, roadways and bridges. Substantial morbidity and mortality remains associated with thrombotic events has stimulated the rapid expansion of the available armamentarium to combat pathologic thrombosis. Pathologic thrombosis plays an essential role in the pathogenesis of acute coronary syndromes (ACS), ischemic complications of percutaneous coronary intervention (PCI), venous thromboembolic disease, and embolic complications of arrhythmias and various cardiomyopathies. Written by experts in the field, Antithrombotic Drug Therapy in Cardiovascular Disease carefully examines individual and various combinations of the available antithrombotic regimens including fibrinolytic agents, antiplatelet therapies (aspirin, thienopyridines, glycoprotein IIb/IIIa inhibitors), and anticoagulant therapies (unfractionated heparin, low-molecular-weight heparins, direct thrombin inhibitors, and synthetic factor X inhibitors), non-ST-segment elevation (NSTEMI) ACS and ST-segment elevation myocardial infarction (STEMI). A detailed overview, Antithrombotic Drug Therapy in Cardiovascular Disease presents the evidence demonstrating the efficacy of available antithrombotic therapies in specific disease states such as atrial fibrillation, cardiomyopathy, valvular heart disease, and heparin-induced thrombocytopenia (HIT). This definitive text spans the whole spectrum of interventional cardiology procedures, also covering structural heart disease. The very latest techniques and devices are covered in detail to provide practical, evidence-based guidance on treating the full range of coronary lesions. A systematic review and economic evaluation of prasugrel compared to clopidogrel after PCI Patients who have undergone percutaneous coronary intervention (PCI) for coronary artery disease usually get a platelet inhibitor (e.g. clopidogrel) for one year after the procedure. Prasugrel is a new platelet inhibitor which is available for patients with acute coronary syndrome (ACS) who undergo PCI in Norway. We aimed to analyze the efficacy and cost-effectiveness of prasugrel compared to clopidogrel for ACS patients who have undergone PCI. This analysis was commissioned by the Norwegian Medicines Agency to support their decision on whether to give reimbursement to prasugrel as well as clopidogrel, which is reimbursed today. We performed a systematic review of randomised controlled trials (RCTs) to estimate the efficacy of prasugrel compared to clopidogrel. Cost-effectiveness analyses were performed in a previously developed Markov model (MOCCA) which simulates clinical events after a PCI is performed. In the model, health and costs are calculated to give the remaining life expectancy and lifetime costs, which again are used to calculate incremental cost-effectiveness of prasugrel compared to clopidogrel. Key messages1. Prasugrel significantly reduces rates of myocardial infarction and urgent target vessel revascularization compared to clopidogrel in both short term (up to 1 month) and long term (up to 15 months). Quality of the evidence was high and moderate for myocardial infarction and low and moderate for urgent target vessel revascularization.2. Prasugrel significantly increases rates of bleeding events compared to clopidogrel in both short term and long term data. Quality of the evidence for this outcome was high and low, respectively.3. The analyses on short and long term effects on mortality revealed no statistically significant differences. Quality of the evidence for this

outcome was low and moderate, respectively.⁴ Prasugrel is cost-effective compared to clopidogrel for ACS patients who have undergone PCI. Our analyses indicate however that there is uncertainty surrounding the cost-effectiveness result.⁵ Uncertainty related to efficacy on mortality and, hence also, cost-effectiveness could be reduced if new randomised controlled trials are performed. Coronary stenting is the most commonly used method of myocardial revascularization, with approximately 2 million stents implanted in 2004 throughout the world. The development of drug eluting stents has resulted in very low rates of repeat intervention and will further increase the scope for percutaneous coronary intervention. This issue of *Interventional Cardiology Clinics*, guest edited by Dr. Binita Shah, will cover the latest updated in Transradial Angiography and Intervention. This issue is one of four selected each year by the series Editor-in-Chief, Dr. Matthew Price. Topics discussed in this issue will include: Accessing the Wrist, Coronary Cannulation, Optimizing Transradial Access, The Value of Transradial: Healthcare Economics and Patient Satisfaction, Vascular Complications of the Wrist: Prevention and Management, #RadialFirst in CHiP and Cardiogenic Shock, Radial versus Femoral Access in Acute Coronary Syndrome, Accessing the Arm for Peripheral Interventions, Using the Arm for Structural Interventions, and the Neuro Radialist. The past 50 years have witnessed a breathtaking evolution in the approaches to the patient with an acute ST elevation myocardial infarction. In the 1960s, the now commonplace cardiac intensive care unit was but a nascent idea. Without much to offer the patient but weeks of absolute bedrest, substantial morbidity and high rates of mortality were the norm. Just 30 years ago, seminal discoveries by DeWood and colleagues suggested that the culprit was plaque rupture with thrombosis, not progressive luminal compromise. Subsequent fibrinolyt- based strategies resulted in a halving of the mortality of acute myocardial infarction. With the introduction of balloon angioplasty in the late 1970s, a few interventional cardiologists braved the question: why not perform emergency angioplasty as a primary reperfusion strategy? Indeed, reports of successful reperfusion via balloon angioplasty appeared (mostly in local newspapers) as early as 1980. Despite being thought of as heretical by mainstream cardiology, these pioneers nonetheless persevered, proving the benefit of "state-of-the-art" balloon angioplasty compared with "state-of-t- art" thrombolytic therapy in a series of landmark trials published in the *New England Journal of Medicine* in March of 1993. Publication of the first edition of *Primary Angioplasty in Acute Myocardial Infarction* in 2002 to some extent anticipated the widespread acceptance of primary percutaneous coronary intervention as the standard of care. Since then, in all respects, the evolution of emergency percutaneous revascularization has only accelerated. The universal replacement of balloon angioplasty with stent implantation was clearly one key. This second edition is a ground-breaking clinical text with a strong emphasis on rigorous evidence. Leaders in the field discuss best practice in the light of systematic reviews and randomised control trials, and how best to treat where the information is less clear. Case histories provide intriguing discussions on how to apply the evidence in real life situations. Evidence-based Cardiology also includes free access to the latest evidence, which is automatically posted on a companion

Key Points boxes at the beginning of each chapter summarize the most important facts. Cardiovascular disease is ranked as the leading cause of death world wide, responsible for 17.1 million deaths globally each year. Such numbers are often difficult to comprehend. Heart disease kills one person every 34 seconds in the USA alone. Although the leading killer, the incidence of cardiovascular disease has declined in recent years due to a better understanding of the pathology, implementation of lipid lowering therapy new drug regimens including low molecular weight heparin and antiplatelet drugs such as glycoprotein IIb/IIIa receptor inhibitors and acute surgical intervention. The disease burden has a great financial impact on global healthcare systems and major economic consequences for world economies. This text aims to deliver the current understanding of coronary artery disease and is split into three main sections: 1. Epidemiology and pathophysiology of coronary artery disease 2. Coronary artery disease diagnostics and 3. Treatment regimens for coronary artery disease Identity theft and other confidential information theft have now topped the charts as the leading cybercrime.
